

IAP20 Rec'd PCT/PTO 16 DEC 2005

ABSTRACT OF THE DISCLOSURE

The disclosure relates to a system for remote controlling equipment, which allows at least one server and at least one remote piece of equipment to be interconnected according to the MQIsdp protocol. Said system associates radiocommunication means with at least one of said remote pieces of equipment in order to internally process a communication protocol that uses API-type source functions which are available on a software platform (open AT) allowing at least one application to be hosted. Said radiocommunication means are provided with a set of specific (API) functions in order to exchange data with at least one server that uses said MQIsdp protocol such that said server/s and said remote piece/s of equipment can be interconnected via said radiocommunication means which also manage at least one application located between the server/s and the remote piece/s of equipment.
